MuditaOS K 1.6

The latest update to MuditaOS K (version 1.6) introduces a range of meaningful improvements focused on usability, system stability, and user privacy. Staying true to its minimalist philosophy, Mudita continues to refine the experience while adding features that enhance everyday use.

MuditaOS K

- Added security patches, including fixes for vulnerabilities related to privilege escalation, cross-profile information disclosure, media parsing.
- Added a global "Notification vibration" toggle in the Vibration and Haptic section that lets you turn off vibration for text messages, calendar and third-party alerts with a single switch
- The documents in the legal section are now displayed with the improved formatting
- Fixed the save button for hotspot setting without a hotspot name
- Fixed the possibility to make factory reset with incorrect password
- Fixed the PIN requirement when restarting phone with Offline+ turned ON
- Fixed the FCC ID missing name and logo
- Fixed the keyboard behavior when crash popup is displayed
- Fixed the Cancel button for double SIM card enabling scenario
- Fixed the overflow of the optional eSIM deletion option
- Fixed the screen brightness when the device is turned off and battery charge is 100%
- Fixed the message after the incorrect PUK attempt
- Added information about remaining attempts of PUK code

Alarm

- Added an option to independently enable or disable vibration settings for each individual alarm

- Fixed an issue that caused inconsistent translation options for the alarm repetition settings across multiple languages
- Fixed an issue that prevented snoozed alarm notifications from displaying the correct time and alarm name after editing

Calendar

- Fixed a user interface layout issue where an unnecessary scrollbar would briefly appear on the all-day events list screen

Contacts

- Fixed an issue in group messaging where selecting a contact unexpectedly forced the active list selection out of view
- Fixed an error where long-pressing a contact's favorite or edit key displayed an unwanted label
- Fixed an issue where the recent calls log failed to instantly refresh when a new phone call arrived during active contact detail lookups
- Fixed a text alignment bug where the empty contact list placeholder header was not properly centered when set to Italian

eSIM

- Fixed a view refresh issue where deleting an eSIM profile and then locking the phone caused the screen to turn blank

Kompakt Keyboard

- You can now choose from 38 different keyboard languages
- New specific keyboard layouts are now available for Danish, Norwegian, Finnish, Swedish, Swiss French, and Latin Serbian
- Added Cyrillic keyboard layouts for Belarusian, Russian, Ukrainian, Bulgarian, and Serbian languages
- New configuration toggles are available in the text correction section that grant control over personalized and predictive word suggestions
- You can now benefit from personalized suggestions that learn your most frequently typed custom words over time

- You can now choose to see automated next-word suggestions in the suggestion bar to write messages with fewer taps
- Improved the process for adding, editing, and deleting custom input styles
- Added a notification prompt to alert you if you try to add a duplicate layout
- Improved the process of accessing keyboard settings for external keyboards
- Fixed an issue that caused the scrollbar in the languages list view to update with a brief delay
- Fixed an issue that caused an empty white background to hide text input sections when an external Bluetooth keyboard was connected
- Fixed an issue in the keyboard settings where the layout options for Swiss German were missing proper language translations
- Adjusted asymmetric margins and incorrect element spacing in the keyboard settings

Launcher

- Added notification about voicemail in MWI operators

Maps

- Added a guided setup flow during first launch to help you enable location permissions and A-GPS for accurate positioning
- Improved the initial setup flow by guiding you to the manual map selection page if location sharing is denied
- Improved the setup process by adding map download recommendations tailored to your region when location services are active
- Added clear notifications during initial setup to inform you when there isn't enough storage space to download a map or when a map download fails due to a missing Wi-Fi or internet connection
- Added notifications during map setup to clarify that downloads pause when Offline Mode is active
- Added a badge notification to easily see when an updated version of your downloaded map becomes available

- Set the default navigation mode to "Driving"
- Improved the address search feature to accurately find and pinpoint locations regardless of the regional format you type
- Added a visual area circle on the map to show your approximate location while the app finishes acquiring a precise location signal

Notes

- You can now create a Task list that allows adding check marks to the items on the list

Onboarding

- EULA document is now displayed in new format for easier read

Phone

- You can now view voicemail notifications directly on the Phone app icon and at the top of your recent calls list on supported networks (mainly US networks). If your network does not support this feature, you will continue to receive new voicemail notifications via text message
- You can now instantly call your voicemail by simply long-pressing the '1' key on the phone dial pad. If a long-press shortcut fails due to an unassigned voicemail number, you will be informed with a clear notification
- Added an option in the application settings to manually set or update your voicemail number
- Improved the call log history to automatically refresh and cycle out old entries when reaching maximum capacity limits
- Fixed an issue where the phone call status icon remained stuck inside the top status bar area even after the call was ended

- Fixed an issue in the Phone settings menu that prevented modified Quick Message templates from reverting back to defaults
- Fixed a visual glitch in the recent calls history screen that showed an unnecessary zero before single-digit hours in 12-hour time mode
- Unified the contact creation menu options for Phone and SMS app

SMS

- Fixed a text layout issue in group chat participant list where the seventh conversation participant's name was cut off from view
- Fixed an issue where visual confirmation failed to display when blocking or unblocking message senders who are unsaved in contacts
- Fixed an issue where conversations displayed phone numbers instead of the contact names saved to SIM memory
- Fixed an issue where phone number could not be copied via long-press from the number details view
- Fixed an issue where receiving a group message incorrectly triggered duplicate notifications for subsequent individual text messages

System Update

- Fixed the incorrect icon in the offline+ modal

Voice Recorder

- Fixed the polish translation in the message when deleting recording
- Fixed the save and leave modal alignment

Weather

- Fixed an issue where the main view would show the wrong error message if a location didn't return a valid name

- Fixed a network data issue that blocked the Weather interface from syncing current forecast data while using a Bluetooth-tethered internet connection
- Fixed an issue where high and low temperatures would overlap within the Weather widget
- Fixed a text layout error where three-digit Fahrenheit temperatures would not display in a single line
- Fixed missing translations for temperature log abbreviations when the device language is set to Spanish
